

12,000

RAIN GARDENS

in Puget Sound

Help us build 12,000 rain gardens around Puget Sound by 2016. A rain garden is a shallow depression planted with a variety of flowers, shrubs, and grasses that tolerate wet winters and dry summers. Rain gardens function like native forests to help slow down, soak up and filter polluted water from downspouts, driveways and sidewalks.

BENEFITS

- ◆ Prevent flooding
- ◆ Filter oil, grease, and toxics
- ◆ Help recharge groundwater
- ◆ Attract birds and butterflies
